2.6 Environment And Energy Program Area Description

Mission

The 1995 "National Science & Technology Council Report, Goals for a National Partnership in Aeronautics Research and Technology," predicted that: "Environmental issues are likely to impose the fundamental limitation on air transportation growth in the 21st century." Thus, the scientific assessment and development of safe and affordable options for mitigating the impacts of aircraft noise and emissions are important not only to protect the environment but also to sustain the growth of aviation. In response, the FAA has adopted the following strategies:

- Lead a cooperative development effort that balances noise reduction with adequate airport capacity.
- Manage FAA activities to understand and minimize adverse environmental consequences and comply with all federal statutes.
- Stimulate private industry and government sponsored research to reduce noise, emissions, and energy consumption by the aviation sector.
- Harmonize international aircraft noise and engine emissions certification standards.

Intended Outcomes

Through an optimal mix of aircraft and engine certification standards, operational procedures, compatible land use, and abatement technology, the FAA intends to minimize the global, regional, and local impact of aircraft noise and exhaust emissions.

Program Area Outputs

FAA aviation environmental research produces:

- Guidance for noise and emissions standards for the certification of new and modified airframe and engine type designs.
- Technical guidance on certification procedures and practices for manufacturers and modifiers in the form of technical reports, handbooks, advisory circulars, training courses, and rules.
- Computer models and impact criteria for civil aviation authorities to use in the environmental assessment of proposed actions.

Program Area Structure

The aviation environmental research program is a single budget line item, Environment and Energy, and composed of the following major elements:

- · Aircraft noise control
- Engine exhaust emissions control
- Aviation noise analysis
- Aviation emissions analysis

These topics form a cohesive system of research projects that support federal actions to identify, control, and mitigate the environmental consequences of aviation activity.

Customer and Stakeholder Involvement

To mitigate potential adverse impacts to the environment, the FAA works closely with other federal agencies, industry, and foreign governments through a unified regulatory-R&D approach to assess environmental concerns, plan R&D, shape technical requirements, identify feasible abatement technologies or other mitigation actions, and implement aircraft and engine certification regulations. The agency utilizes the following arenas to promote collaboration on aviation environmental issues:

The Aviation Regulatory Advisory Committee (ARAC) — a formal standing committee composed of representatives from aviation associations and industry. Established by the FAA, ARAC provides industry's recommendations, advice, and information applicable to the full range of FAA rulemaking activities. The harmonization working groups under ARAC have been tasked to ensure that certification regulations impacting both domestic and foreign parties do not impose inconsistent standards in participating countries.

The International Civil Aviation Organization's (ICAO) Committee on Aviation Environmental Protection (CAEP) — a standing committee that establishes and assesses the adequacy of international aviation environmental standards, especially in the areas of aircraft noise and engine exhaust emissions. The FAA participates as the United States member along with representatives of other civil aviation authorities and observers from aviation industry.

The Federal Interagency Committee on Aviation Noise (FICAN) — a permanent body that conducts annual public forums in different geographic regions of the nation to solicit general input on aviation noise. FICAN was established by the FAA and other federal agencies with ongoing interests in better aligning R&D with the public's concerns.

Accomplishments

In recent years, the program has produced the following:

- Six reports to Congress on the annual progress of the FAA/NASA subsonic jet noise research program.
- Advances in the computer models used for airport and heliport noise analysis. Over 1000 copies have been sold around the world. In the U.S., these models have been used in over 150 airport studies involving more than \$1.3 billion in airport noise compatibility grants.
- Five public forums on aviation noise research in Atlanta, Minneapolis, San Diego, Seattle, and Washington. Public participation has resulted in four FICAN annual reports, one report on federal aviation noise research projects, a report to Congress on the effects of aircraft noise, a federal finding on the relationship between aircraft noise and sleep awakenings, and various new federal research projects on commuter airplane noise impacts and the influence of ambient noise on community annoyance.
- Publication of a study conducted to assess the impact of NAS modernization on aircraft emissions.
- Development of Advisory Circular (AC) 34-1, which is a companion document to the regulation, 14 CFR part 34, that specifies acceptable processes and procedures to be used to implement the regulation.
- Development of the FAA Aircraft Engine Emission Database (FAEED).
- Contributions to the publication of the Intergovernmental Panel on Climate Change (IPCC) special report on Aviation and the Global Atmosphere.
- An aircraft overflight noise exposure prediction model for Grand Canyon National Park.

- A new aircraft noise and performance database for use in FAA's Integrated Noise Model (INM).
- A new Advisory Circular containing guidance on the procedures to demonstrate compliance with aircraft noise standards.
- Harmonization of the FAA jet noise certification regulations with those of the European Joint Aviation Authorities.

R&D Partnerships

FAA participates with others in the aviation community in the following joint R&D efforts:

- A series of Memorandums of Understanding enabling the FAA to work with NASA and U.S. industry to identify source noise and emissions abatement technologies.
- Collaboration with the EPA, NASA, industry, and academia to assess the local and global impacts of aircraft engine exhaust emissions.
- Support of the Volpe National Transportation Systems Center's (VNTSC) continuing efforts to provide substantial technical assistance in aircraft noise measurement and assessment.

In addition to the FAA, the U.S. Air Force, the U.S. Army, the U.S. Navy, the Department of Interior, the Department of Transportation, the U.S. Environmental Protection Agency, NASA, and the Department of Housing and Urban Development participate on FICAN, the recognized forum for partnership among all federal agencies concerned with aviation noise. FICAN has led to expanded coordinated and cooperative research efforts among the individual agencies and, thus, results in more efficient use of federal funds. Agencies have signed a letter of understanding formally documenting their participation on the committee and defining its purpose, scope, membership, process, and products.

Long-Range View

Planning for environmental research needs requires a look at key indicators. These are generally described as driving forces for change, targets of opportunities, or future (environmental) threats. Some key indicators that may influence aviation environmental research include:

- Scientific findings
- Air transportation growth

- New aviation technologies
- Increased globalization of aviation
- Reduced federal resources

FAA predicts steady growth of the demand for aviation services through the first decade of the new millennium. The growth in aircraft operations required to meet this demand will result in increased environmental impacts and thus create barriers to further growth.

The key to successful environmental planning is to identify operational mitigation options for those sectors of the growing aviation markets that are most likely to reach environmental critical mass. The FAA will need to continue to determine where best to target its research to achieve noise mitigation.

Major NASA aeronautics research programs, most notably the AST program, have come to an end. Several technologies from these NASA research programs will enter the marketplace within 10-15 years for use by U.S. industry in the next generations of aircraft. With the end of the AST program, FAA will close its companion research program on subsonic noise reduction. The agency will use its research findings to consider new environmental certification standards and procedures for the next generation of transport aircraft. FAA will shift future environmental research in the field of new aircraft technology toward other research programs and emphasize rotorcraft and general aviation, but also begin a collaboration with the new NASA Quiet Aircraft Technology program.

The solution to controlling the environmental consequences of new aircraft technologies is through a coordinated regulatory and R&D approach involving the FAA with other federal agencies, such as EPA, NASA and DOD, from the early stages of the technology research. While human (animal) behavioral research is generally not the responsibility of the FAA, the agency must devote research resources to apply pertinent scientific findings on environmental impacts into federal guidance and policy.

Technologies, such as the Global Positioning System (GPS), are already beginning to have a profound effect on the aviation system. As these technologies are being introduced to improve systems.

tem efficiency and flexibility, a new FAA paradigm is emerging under the general term, "Free Flight." As the FAA builds more user flexibility into the NAS, the agency must expand the current suite of environmental analysis tools in all domains to determine the likely environmental impacts and improvements stemming from its support of Free Flight.

The findings of earlier FAA and NASA scientific studies have now been incorporated in the IPCC "Special Report on Aviation and the Global Atmosphere," and ICAO is studying measures for reducing greenhouse gas emissions, as well as emissions that affect local air quality.

As stated in FAA's 1998 Strategic Plan, "The globalization of aerospace, U.S. business, and travel is another factor driving change." FAA must plan research efforts to support continued international harmonization and standardization of the aviation environmental certification standards and procedures.

The prospect of reduced resources has driven FAA to reorganize and streamline in order to operate more productively and to identify mission-critical services. Historically, environmental research has accounted for only about 2% of the R,E&D budget. Funding constraints and further reductions are expected to continue to put a premium on identifying the research projects that are critical to FAA's environmental mission. FAA must continually assess the situation in order to effectively target its diminishing resources. Projects that will best address the agency's prime environmental responsibilities through the promulgation of new or improved aviation environmental standards must be given top priority.

To more effectively channel the diminished research resources, FAA sponsored the Aviation Environmental Research Beyond 2000 project. Through a series of public meetings and workshops, FAA identified environmental issues and needs that could be addressed through research. The proposed FY 2002 research program addresses the R&D effort to support an effective environmental mitigation strategy and to identify the best approaches for addressing current environmental concerns.

A09a — Environment and Energy

GOALS:

Intended Outcomes: The FAA intends to:

- Optimize the mix new aircraft certification standards, operational procedures, compatible land use, and abatement technology in order to prevent any increase in the impact of aircraft noise upon the population exposed to Day/Night operating conditions. Through previous actions, the FAA reduced this impact by 80 percent from the 1992 Level (65dB).
- Define and minimize the impact of aircraft emissions, through an optimal mix of new aircraft certification standards, operational procedures, and abatement technology.
- Improve analytic and planning tools in order to provide a better understanding of aviation's environmental impacts, and give insight into the consequences of alternative courses of action.

Agency Outputs: The findings of aviation environmental research have resulted in the publication of significant standards, rules and technical guidance including:

- Standards for the certification of new and modified designs for the reduction of aircraft noise and engine exhaust emissions.
- Technical reports, handbooks, Advisory Circulars (AC), training courses, and procedures for use by manufacturers and modifiers.
- Computer models and impact criteria for use by civil aviation authorities in the environmental assessment of proposed actions.

Customer/Stakeholder Involvement: The FAA uses a unified regulatory R&D approach—working closely with other federal agencies, industry, and foreign governments—to guide R&D efforts into the impact of aviation upon the environment. Lessons learned from this research identify and shape technologies, regulations, and certification criteria that offer potential to improve our present and future global environment.

The Aviation Regulatory Advisory Committee (ARAC) is a formal standing committee, com-

posed of representatives from aviation associations and industry. Established by the FAA, ARAC provides industry input in the form of recommendations, advice, and information to be considered in the full range of FAA rulemaking activities. ARAC harmonization working groups have been tasked to ensure that the aircraft noise certification regulations that impact both domestic and foreign parties do not impose different standards in each country involved.

The FAA represents the United States on the International Civil Aviation Organization's (ICAO) Committee on Aviation Environmental Protection (CAEP) along with representatives of other civil aviation authorities and observers from the aviation industry. The purpose of CAEP is to establish and assess the adequacy of international aviation environmental standards, especially in the areas of aircraft noise and engine exhaust emissions standards.

The FAA and other interested federal agencies established the Federal Interagency Committee on Aviation Noise (FICAN) to provide forums for debate over needs for future aviation noise research and to encourage new efforts in this area. FICAN conducts annual public forums in different geographic regions to solicit general input on aviation noise impacts with the intent to better align research with the public's concerns.

The Aviation Environmental Research Program directly supports the General Aviation (GA) action plan in demonstrating noise abatement technologies for light propeller driven airplanes.

Accomplishments:

- Produced reports to Congress—
 - Report on quiet aircraft technology for light propeller driven airplanes and helicopters. The finding of this report has led to a joint FAA/NASA research project on general aviation noise.
 - Report on the effects of aircraft noise.
 - Five reports on the annual progress of the FAA/NASA subsonic jet noise research program.
- Developed advanced computer models— Used for airport and heliport noise analysis.

Have resulted in over 1000 copies sold around the world. In the United States, these models have been used in over 160 airport studies involving more than \$1.3 billion in airport noise compatibility grants. This program has also produced an aircraft overflight noise exposure prediction model for Grand Canyon National Park.

- Public forums on aviation noise research:
 - Atlanta
 - Minneapolis
 - San Diego
 - Seattle
 - Washington, DC
- Special reports and findings:
 - Four FICAN annual reports
 - One report on federal aviation noise research projects
 - One federal finding on the relationship between aircraft noise and sleep awakenings

Funding has also led to enhancements to the computer model used for airport air quality analysis and formal acceptance by the Environmental Protection Agency (EPA) as a preferred guideline mode, EPA's highest ranking, and to the development of a handbook on the procedures for airport air quality analysis for use by civil and military aviation authorities. Standardizing the civilian and military analytical procedures will improve the quality of environmental assessments that are reviewed by the Federal Government.

R&D Partnerships: The FAA works closely with NASA through a series of Memorandums of Understanding to identify source abatement technologies. The FAA also participates with NASA, industry, and academia to assess the possible global impact of aircraft engine exhaust emissions. The Volpe National Transportation Systems Center (VNTSC) continues to provide substantial technical assistance in the areas of aircraft noise measurement and assessment. FICAN is also a forum for partnership as all Federal agencies concerned with aviation noise are represented on the Committee. FICAN has

led to expanded coordinated and cooperative research efforts among the individual agencies and resulted in more efficient use of federal funds.

MAJOR ACTIVITIES AND ANTICIPATED FY 2001 ACCOMPLISHMENTS:

Aircraft noise reduction and control

- Submitted final report to Congress on the joint FAA/NASA subsonic jet noise reduction technology program.
- Harmonized FAA helicopter noise certification regulations with those of the European Joint Aviation Authorities that govern the procedures used by airframe manufacturers.

Engine emissions reduction and control

- Updated the FAA Engine Exhaust Emissions
 Database to be consistent with the ICAO databank.
- Continued to examine alternative, simplified engine exhaust emissions measurement procedures to reduce manufacturers certification test costs.
- Published the FAA Advisory Circular (AC) 34-1, including field practices and technical guidance related to engine emissions certification.

Aviation environmental analysis

- Released Integrated Noise Model (INM) Version 6 for use in airport noise assessments.
- Completed the first phase of the validation of the Grand Canyon National Park aircraft overflight noise model.
- Continued to examine and validate methodologies used to assess aircraft noise exposure and impact.
- Finalized the release of the new Emissions And Dispersion Modeling System (EDMS) version 4.0, including new dispersion algortihms, airplane performance data, and updated databases for aircraft engine and ground support equipment (GSE).
- Initiated development of the prototype modeling System For Assessing Aviation Global Emissions (SAGE).

KEY FY 2002 PRODUCTS AND MILE-STONES:

Aircraft noise control

• Publish an update of the noise certification handbook (replacement for AC 36-4).

Engine emissions control

 Develop harmonized, simplified engine exhaust emissions certification test procedures and technical guidance materials that will increase efficiency and reduce costs of the tests.

Aviation noise analysis

Continue to examine and validate methodologies used to assess aircraft noise exposure and impact.

Aviation emissions analysis

- Continue to examine and validate methodologies used to assess aviation emissions and their impact on air quality.
- Complete development of the prototype SAGE model for assessing aviation's global emissions.

FY 2002 PROGRAM REQUEST:

Major NASA aeronautics research programs have come to an end. Several new source technologies will emerge from NASA's research. This will be the basis, in five to seven years, for the next generation of U.S. industry aircraft. The FAA will close its companion research program on subsonic noise reduction and use its research findings to identify new environmental certification standards and procedures for the next generation of transport aircraft. The FAA will shift future environmental research towards development of new and of improved computer models that will be used to assess aircraft noise, local air quality, and global climate change. In accordance with the National Environmental Policy Act, the FAA must consider and mitigate the environmental consequences of its actions. A variety of methodologies and research are necessary to support and properly assess the environmental impact of aviation. The objective is to enhance and advance computer modeling techniques to better estimate environmental impacts. The FAA will continue to work with NASA, the manufacturing industry, and foreign authorities to provide technical support for development and implementation of aircraft environmental certification regulations through proactive response to changes in technology, measurement/analysis technology, regulatory policy, and international regulatory initiatives.
